

## EXAMPLE Problem 3

**Heat** Suppose that you are camping in the mountains. You need to melt 1.50 kg of snow at  $0.0^\circ\text{C}$  and heat it to  $70.0^\circ\text{C}$  to make hot cocoa. How much heat will be needed?

### 1 Analyze and Sketch the Problem

- Sketch the relationship between heat and water in its solid and liquid states.
- Sketch the transfer of heat as the temperature of the water increases.

**Known:**

$$\begin{aligned} m &= 1.50 \text{ kg} & H_f &= 3.34 \times 10^5 \text{ J/kg} \\ T_i &= 0.0^\circ\text{C} & T_f &= 70.0^\circ\text{C} \\ C &= 4180 \text{ J/kg}\cdot^\circ\text{C} \end{aligned}$$

**Unknown:**

$$\begin{aligned} Q_{\text{melt ice}} &= ? \\ Q_{\text{heat liquid}} &= ? \\ Q_{\text{total}} &= ? \end{aligned}$$

### 2 Solve for the Unknown

Calculate the heat needed to melt ice.

$$\begin{aligned} Q_{\text{melt ice}} &= mH_f \\ &= (1.50 \text{ kg})(3.34 \times 10^5 \text{ J/kg}) \\ &= 5.01 \times 10^5 \text{ J} \\ &= 5.01 \times 10^2 \text{ kJ} \end{aligned}$$

Substitute  $m = 1.50 \text{ kg}$ ,  $H_f = 3.34 \times 10^5 \text{ J/kg}$

Calculate the temperature change.

$$\begin{aligned} \Delta T &= T_f - T_i \\ &= 70.0^\circ\text{C} - 0.0^\circ\text{C} \\ &= 70.0^\circ\text{C} \end{aligned}$$

Substitute  $T_f = 70.0^\circ\text{C}$ ,  $T_i = 0.0^\circ\text{C}$

Calculate the heat needed to raise the water temperature.

$$\begin{aligned} Q_{\text{heat liquid}} &= mC\Delta T \\ &= (1.50 \text{ kg})(4180 \text{ J/kg}\cdot^\circ\text{C})(70.0^\circ\text{C}) \\ &= 4.39 \times 10^5 \text{ J} \\ &= 4.39 \times 10^2 \text{ kJ} \end{aligned}$$

Substitute  $m = 1.50 \text{ kg}$ ,  $C = 4180 \text{ J/kg}\cdot^\circ\text{C}$ ,  $\Delta T = 70.0^\circ\text{C}$

Calculate the total amount of heat needed.

$$\begin{aligned} Q_{\text{total}} &= Q_{\text{melt ice}} + Q_{\text{heat liquid}} \\ &= 5.01 \times 10^2 \text{ kJ} + 4.39 \times 10^2 \text{ kJ} \\ &= 9.40 \times 10^2 \text{ kJ} \end{aligned}$$

Substitute  $Q_{\text{melt ice}} = 5.01 \times 10^2 \text{ kJ}$ ,  $Q_{\text{heat liquid}} = 4.39 \times 10^2 \text{ kJ}$

### 3 Evaluate the Answer

- Are the units correct?** Energy units are in joules.
- Does the sign make sense?**  $Q$  is positive when heat is absorbed.
- Is the magnitude realistic?** The amount of heat needed to melt the ice is greater than the amount of heat needed to increase the water temperature by  $70.0^\circ\text{C}$ . It takes more energy to overcome the forces holding the particles in the solid state than to raise the temperature of water.

## PRACTICE Problems

- Additional Problems, Appendix B
- Solutions to Selected Problems, Appendix C

19. How much heat is absorbed by  $1.00 \times 10^2 \text{ g}$  of ice at  $-20.0^\circ\text{C}$  to become water at  $0.0^\circ\text{C}$ ?

20. A  $2.00 \times 10^2 \text{ g}$  sample of water at  $60.0^\circ\text{C}$  is heated to steam at  $140.0^\circ\text{C}$ . How much heat is absorbed?

21. How much heat is needed to change  $3.00 \times 10^2 \text{ g}$  of ice at  $-30.0^\circ\text{C}$  to steam at  $130.0^\circ\text{C}$ ?

$$\begin{aligned} Q &= Q_{\text{warm}} + Q_{\text{melt}} \\ Q &= Q_{\text{warm}} + Q_{\text{melt}} + Q_{\text{heat}} + Q_{\text{vapor}} + Q_{\text{warm}} \\ Q &= Q_{\text{warm}} + Q_{\text{melt}} + Q_{\text{heat}} + Q_{\text{vapor}} + Q_{\text{warm}} \end{aligned}$$
